Introduction

Introduction to your Router

TW-EAV510 AC WLAN 802.11ac Router is a residential/small office gateway, especially designed for those who need to have the data, video and file sharing services beyond his home and office.

It is an all-in-one advanced device integrating Wireless, Ethernet, 3G/4G/LTE, and NAS (Network Attached Storage) in one unit. As well as being IPv6-capable, the router supports super-fast fiber connections via dual-WAN connectivity through a Gigabit Ethernet WAN port. Also, it also has a USB port, allowing the device to act as a print server as well as a NAS (Network Attached Storage) device. Moreover, the USB port can host a 3G/4G/LTE modem connecting to the 3G/4G/LTE network for Internet access.

Maximum wireless performance

With an integrated 802.11ac Wireless Access Point, The device supports a data rate of up to 1200Mbps and is also compatible with 802.11b/g/n/ac equipment

The Wireless Protected Access (WPA-PSK/WPA2-PSK) and Wireless Encryption Protocol (WEP) features enhance the level of transmission security and access control over wireless LAN. The router also supports the Wi-Fi Protected Setup (WPS) standard, allowing users to establish a secure wireless network by simply pushing a button. If your network requires wider coverage, the built-in Wireless Distribution System (WDS) repeater function allows you to expand your wireless network without the need for any external wires or cables.

3G/4G/LTE Mobility and Always-on Connectivity

With 3G/4G/LTE-based Internet connection (requires an additional 3G/4G/LTE USB modem plugged into the built-in USB port), user can access Internet through 3G/4G/LTE, whether you are seated at your desk or taking a cross-country trip. The auto fail-over feature ensures optimum connectivity and minimum interruption by quickly and smoothly connecting to a 3G/4G/ LTE

network in the event that you ADSL/Fiber/Cable line fails. The device will then automatically reconnect to the ADSL/Fiber/Cable connection when it is restored, reducing connection costs. These features are perfect for office situations when a constant and smooth WAN connection is critical.

IPv6 supported

Internet Protocol version 6 (IPv6) is a version of the Internet Protocol that is designed to succeed IPv4. IPv6 has a vastly larger address space than IPv4. This results from the use of a 128-bit address, whereas IPv4 uses only 32 bits. The new address space thus supports 2^{128} (about 3.4×10^{38}) addresses. This expansion provides flexibility in allocating addresses and routing traffic and eliminates the primary need for network address translation (NAT), which gained widespread deployment as an effort to alleviate IPv4 address exhaustion.

The device fully supports IPv6 (Internet Protocol Version 6), launched as the current IPv4 range is filling up, and IPv6 is gradually becoming the indispensable addressing system for savvy cloud computing users. Dual stack means the router is capable of running IPv4 and IPv6 in parallel during the transition period. With TeleWell IPv6 enabled devices.

Virtual AP

A “Virtual Access Point” is a logical entity that exists within a physical Access Point (AP). When a single physical AP supports multiple “Virtual APs”, each Virtual AP appears to stations (STAs) to be an independent physical AP, even though only a single physical AP is present. For example, multiple Virtual APs might exist within a single physical AP, each advertising a distinct SSID and capability set. Alternatively, multiple Virtual APs might advertise the same SSID but a different capability set – allowing access to be provided via Web Portal, WEP, and WPA simultaneously. Where APs are shared by multiple providers, Virtual APs provide each provider with separate authentication and accounting data for their users, as well as diagnostic information, without sharing sensitive management traffic or data between providers. You can enable the virtual AP.

Web Based GUI

It supports web based GUI for configuration and management. It is user-friendly and comes with online help. It also supports remote management capability for remote users to configure and manage this product.

Firmware Upgradeable

Device can be upgraded to the latest firmware through the WEB based GUI.

Features

Network Protocols and Features

- IPv4 or IPv4 / IPv6 Dual Stack
- NAT, DMZ and ALG
- IPv6 Stateless / Stateful Address Auto-configuration
- IPv6 Router Advertisement
- DHCPv6
- Static Route
- Universal Plug and Play (UPnP) Compliant
- Dynamic Domain Name System (DDNS)
- Virtual Server, DMZ and one-to-one NAT
- SNTP, DNS relay, IGMP snooping and IGMP proxy for video service
- Management based-on IP protocol, port number and address

Firewall

- Built-in NAT Firewall
- Stateful Packet Inspection (SPI)
- DoS attack prevention
- Packet Filtering (v4/v6) - port, source IP address, destination IP address, MAC address
- URL Content Filtering (v4/v6) – string or domain name detection in URL string
- Wireless MAC Filtering

Virtual Private Network (VPN)

- PPTP Client / Server
- L2TP Client / Server
- IPSec
- PPTP / L2TP / IPSec pass-through

Quality of Service Control

- Supports the DiffServ approach
- Traffic prioritization and bandwidth management based-on IPv4 protocol, port number and address

IPTV Applications

- IGMP Snooping and IGMP Proxy
- Quality of Service (QoS)

Wireless LAN

- Compliant with
 - IEEE 802.11 b/g/n/ac standards
 - 2.4 and 5G radio bands for wireless
 - Up to 300 Mbps (11n) and 900Mbps (11ac) wireless operation rate
- 64/128 bits WEP supported for encryption
- WPS (Wi-Fi Protected Setup) for easy setup
- Wireless Security with WEP / WPA-PSK / WPA2-PSK support

Management

- Web-based GUI for remote and local management (IPv4/IPv6)
- Firmware upgrades and configuration data upload and download via web-based GUI
- Embedded Telnet server for remote and local management
- Supports DHCP server / client

Physical Interface

- One RJ-11 port for VDSL / ADSL connection
- One WAN-Port 10/100/1000 Mbps auto-crossover (MDI / MDI-X) Switch
- Four LAN-ports 10/100/1000 Mbps auto-crossover (MDI / MDI-X) Switch
- One USB 2.0 for LTE dongle / Printer / Storage
- WLAN On&OFF / WPS / Factory default reset button
- Power switch
- Power jack
- WLAN: 2 x 5 dBi external antenna

Package Contents

- TeleWell TW-EAV510 AC ADSL2+/VDSL2 WLAN 802.11ac Router
- User Manual
- RJ-45 Cat. 6 STP Ethernet cable
- Power adapter

Important note for using this router

Do not use the router in high humidity or high temperatures

Do not use the same power source for the router as other equipment.

Do not open or repair the case yourself. If the router is too hot, turn off the power immediately and have it repaired at a qualified service center.

Avoid using this product and all accessories outdoors

Warning

Do not use the router in high humidity or high temperatures.

Do not use the same power source for the router as other equipment.

Do not open or repair the case yourself. If the router is too hot, turn off the power immediately and have it repaired at a qualified service center.

Avoid using this product and all accessories outdoors.

Place the router on a stable surface.

Only use the power adapter that comes with the package. Using a different voltage rating power adapter may damage the router.

Device Description

The Front LEDs

LED	Status	Meaning
Power	On	Steady green
	Off	Off
2.4G	Steady Green	2.4G WiFi is ready for using
	Flashing Green	There is no STAs association
	Rapid Flashing Green	There is STAs association connection and traffic
	Off	2.4G WiFi is disabled
5G	Steady Green	5G WiFi is ready for using
	Flashing Green	Data being transmitted/received
	Rapid Flashing Green	There is STAs association connection and traffic
	Off	5G WiFi is disabled
WPS	Flashing Green	Running WPS Configuration
	Off	WPS Stop
VDSL	Steady Green	xDSL Showtime Phase
	Quickly Flashing	xDSL Discovery/Training/Exchange Phase
	Off	No xDSL line connected
USB	On	USB device connected
	Off	USB device not connected
WAN	Steady Green	Ethernet Link Up
	Flashing Green	Ethernet Link Up and traffic
	Off	Ethernet Link Down
LAN1~LAN4	Steady Green	Ethernet Link Up
	Flashing Green	Ethernet Link Up and traffic
	Off	Ethernet Link Down

INT	Steady Green	Device has a public IP via either static/ DHCP/ or IPCP
	Rapid Flashing Green	IP connected and traffic passing
	Off	IP or PPPoE session is idle and dropped, or DSL not connected

The Rear Ports

Port	Meaning
LINE	Connect the supplied Telephone cable to DSL port
WAN	Connect one end of Ethernet cable to the WAN port when connecting other fixed line modem
LAN1-4	Connect a Ethernet cable to one of the LAN ports when connecting to a PC or an office/home network
WiFi	Press and release quickly to enable or disable the 2.4G and 5G Wi-Fi function
RESET	Power on device and wait for 60 seconds, then press it 5 seconds or above to restore to factory default
WPS	Press and release quickly to enable the WPS function
Power	Connect the supplied power adapter to this jack.
Switch	Power ON / OFF switch.
USB	Connect your own 4G dongle or storage or printer device

Basic Installation

The router can be configured through your web browser. A web browser is included as a standard application in the following operating systems: Linux, Mac OS, Windows 8 / 7 / 98 / NT / 2000 / XP / Me / Vista, etc. The product provides an easy and user-friendly interface for configuration.

Please check your PC network components. The TCP/IP protocol stack and Ethernet network adapter must be installed. If not, please refer to your Windows-related or other operating system manuals.

There are ways to connect the router, either through an external repeater hub or connect directly to your PCs. However, make sure that your PCs have an Ethernet interface installed properly prior to connecting the router device. You ought to configure your PCs to obtain an IP address through a DHCP server or a fixed IP address that must be in the same subnet as the router. The default IP address of the router is 192.168.0.254 and the subnet mask is 255.255.255.0 (i.e. any attached PC must be in the same subnet, and have an IP address in the range of 192.168.0.1 to 192.168.0.253).

The best and easiest way is to configure the PC to get an IP address automatically from the router using DHCP. If you encounter any problem accessing the router web interface it is advisable to uninstall your firewall program on your PCs, as they can cause problems accessing the IP address of the router. Users should make their own decisions on what is best to protect their network.

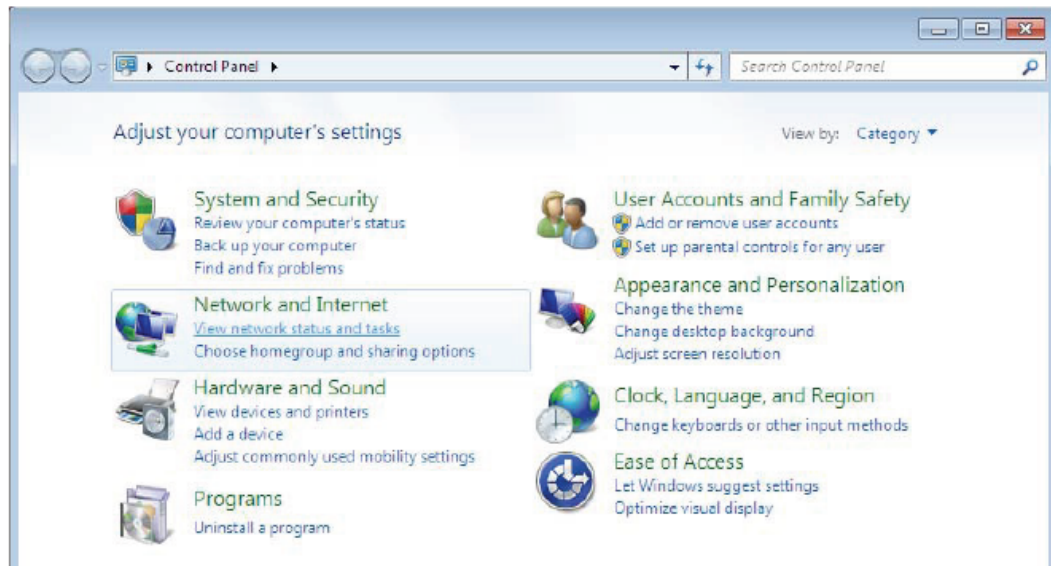

Please follow the following steps to configure your PC network environment.

Any TCP/IP capable workstation can be used to communicate with or through this router. To configure other types of workstations, please consult your manufacturer documentation.

Network Configuration

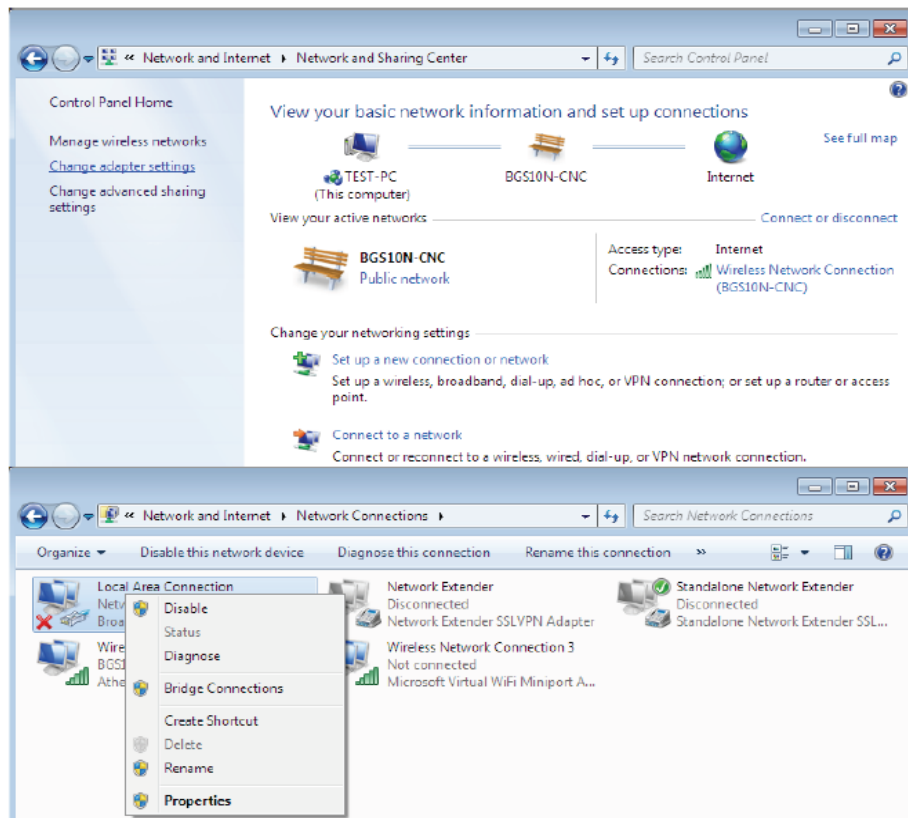

Configuring a PC in Windows 7

Go to Start. Click on Control Panel. Then click on Network and Internet.

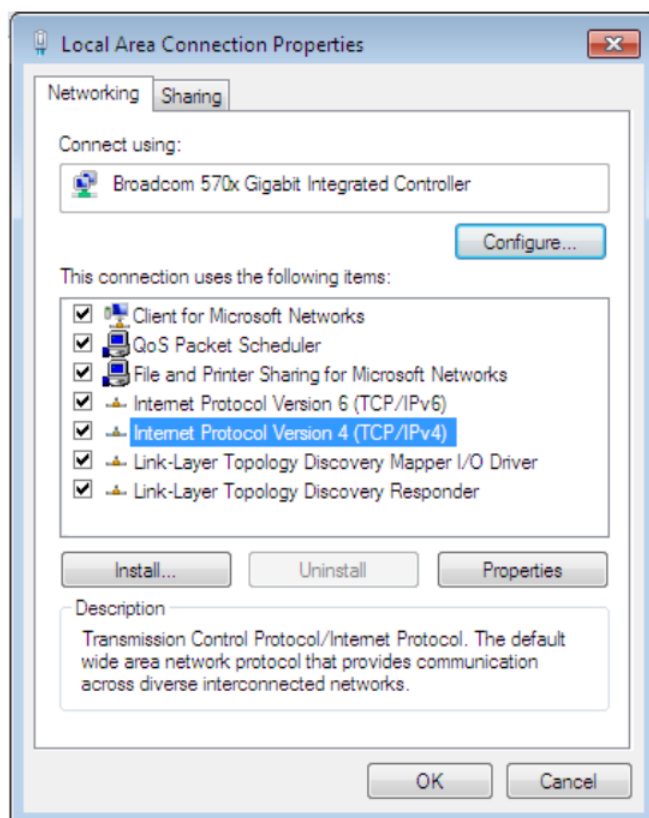

When the Network and Sharing Center window pops up, select and click on Change adapter settings on the left window panel. Select the Local Area Connection, and right click the icon to select Properties.

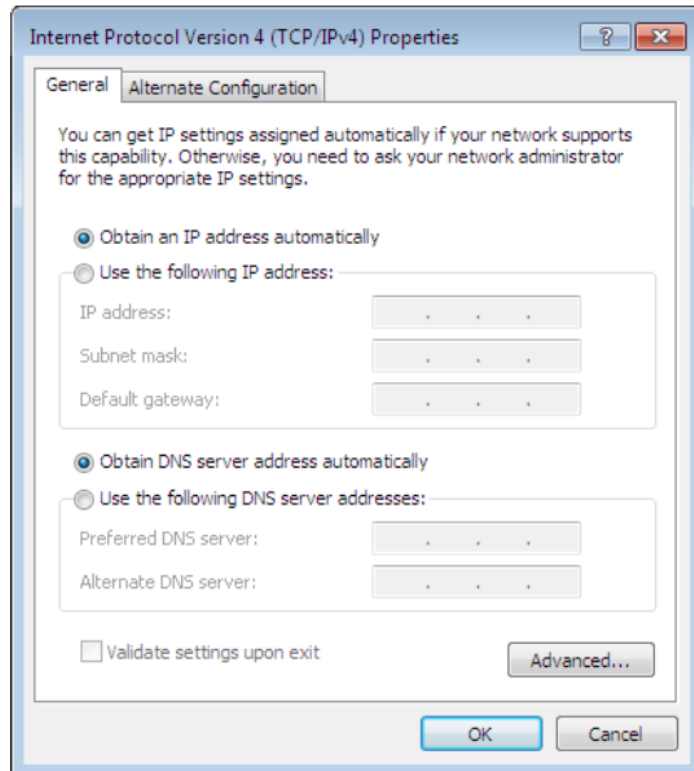

IPv4:

Select Internet Protocol Version 4 (TCP/IPv4) then click Properties.

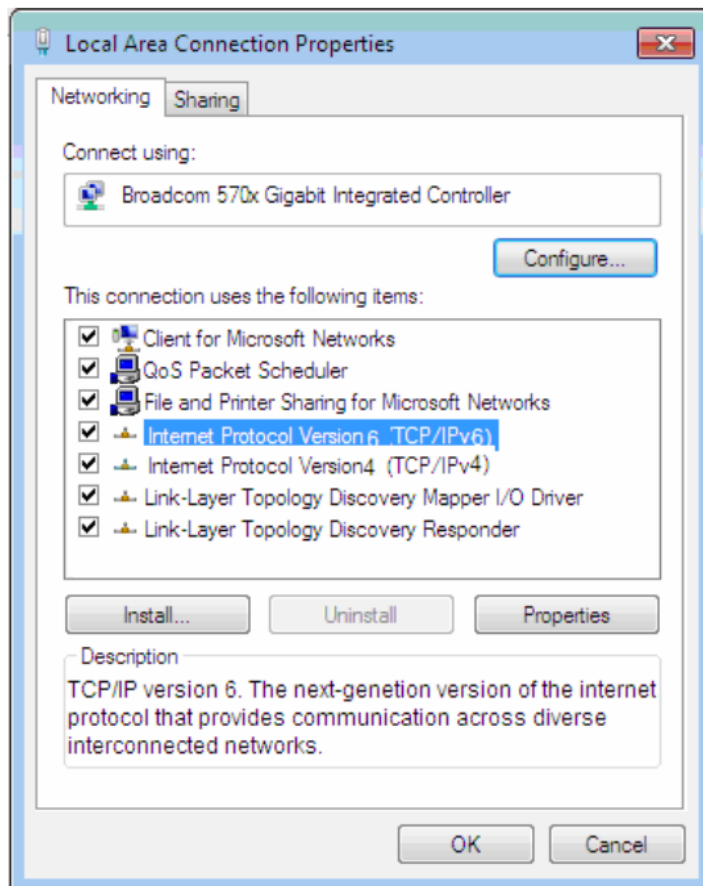

In the TCP/IPv4 properties window, select the Obtain an IP address automatically and Obtain DNS Server address automatically radio buttons. Then click OK to exit the setting. Click OK again in the Local Area Connection Properties window to apply the new configuration.

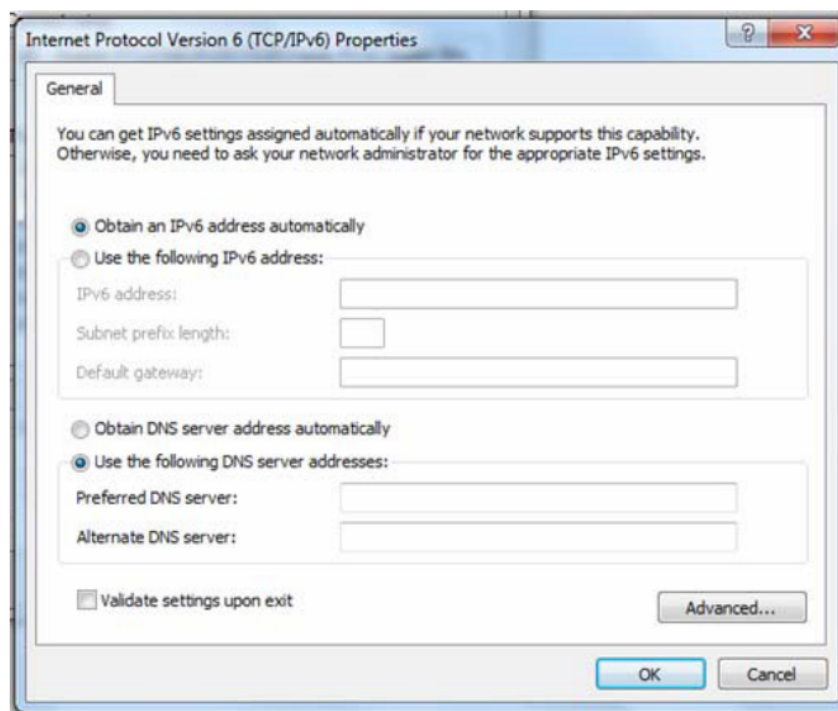

IPv6:

Select Internet Protocol Version 6 (TCP/IPv6) then click Properties

In the TCP/IPv6 properties window, select the Obtain an IPv6 address automatically and Obtain DNS Server address automatically radio buttons. Then click OK to exit the setting. Click OK again in the Local Area Connection Properties window to apply the new configuration.

Factory Default Settings

Before configuring your router, you need to settings.

Web Interface (Username and Password)

Administrator

Username: hallinta

Password: Please check the device label and it is random up to 16 characters.

Attention

If you have forgotten the username and/or password of the router, you can restore the device to its default setting by pressing the Reset Button more than 6 seconds.

Device LAN IPv4 settings

- IPv4 Address: 192.168.0.254
- Subnet Mask: 255.255.255.0

DHCP server for IPv4

- DHCP server is enabled
- Start IP Address: 192.168.0.100
- IP pool counts: 100

Configuration

Configuration via Web Interface

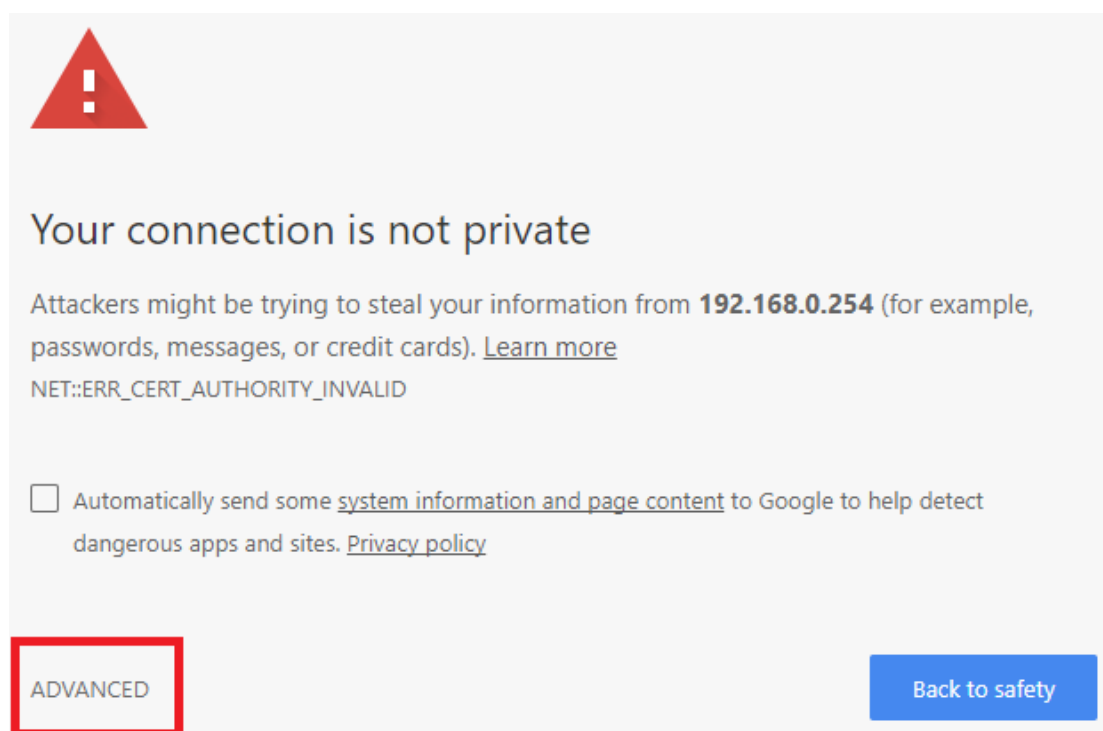

Open your web browser; enter the IP address of your router, which by default is 192.168.0.254, and click ok or press 'Enter' key on the keyboard, a login prompt window will appear.

Congratulations! You are now successfully logged in to the Firewall Router!

The TW-EAV510AC also supports the HTTPS connection, you can enter the URL: <https://192.168.0.254> to establish the secure connection between your PC and Router.

With the HTTPS connection, you will get warning message as below (Google Chrome Browser).

Just click the link “ADVANCED”, and then click link “Proceed to 192.168.0.254 (unsafe)” to establish HTTPS connection with the router.

Your connection is not private

Attackers might be trying to steal your information from **192.168.0.254** (for example, passwords, messages, or credit cards). [Learn more](#)
NET::ERR_CERT_AUTHORITY_INVALID

☐ Automatically send some [system information and page content](#) to Google to help detect dangerous apps and sites. [Privacy policy](#)

HIDE ADVANCED [Back to safety](#)

This server could not prove that it is **192.168.0.254**; its security certificate is not trusted by your computer's operating system. This may be caused by a misconfiguration or an attacker intercepting your connection.

[Proceed to 192.168.0.254 \(unsafe\)](#)

Once you have logged on to your TW-EAV510 AC WLAN 802.11ac Router via your web browser, you can begin to set it up according to your requirements. On the configuration homepage, the left navigation pane links you directly to the setup pages, which include:

Save Log to File: Click Save button to save all system log into a file and download it from WEB browser to your PC.

Clear Log: Click Reset button to clear all existing log.

LAN

This page allows user to set device LAN IP address and DHCP Server for your network.

LAN Interface Settings

This page is used to configure the LAN interface of your Device. Here you may change the setting for IP addresses, subnet mask, etc..

IP Address:	<input type="text" value="192.168.0.254"/>
Subnet Mask:	<input type="text" value="255.255.255.0"/>
IGMP Snooping:	<input type="radio"/> Disabled <input checked="" type="radio"/> Enabled
Ethernet to Wireless Blocking:	<input checked="" type="radio"/> Disabled <input type="radio"/> Enabled

DHCP Settings

DHCP Mode: ☐ NONE ☒ DHCP Server

Enable the DHCP Server if you are using this device as a DHCP server. This page lists the IP address pools available to hosts on your LAN. The device distributes numbers in the pool to hosts on your network as they request Internet access.

IP Pool Range:	<input type="text" value="192.168.0.100"/> - <input type="text" value="192.168.0.200"/>
	<input type="button" value="Show Client"/>
Max Lease Time:	<input type="text" value="86400"/> seconds (-1 indicates an infinite lease)
DomainName:	<input type="text" value="telewell.oy"/>
Gateway Address:	<input type="text" value="192.168.0.254"/>
DNS option:	<input checked="" type="radio"/> Use DNS Relay <input type="radio"/> Set Manually
<input type="button" value="Apply Changes"/> <input type="button" value="MAC-Based Assignment"/>	

IP Address / Subnet Mask: The local management IP address and mask of this device which is also the default gateway IP address for all PCs in local area network.

IGMP Snooping: IGMP snooping is designed to prevent hosts on a local network from receiving traffic for a multicast group they have not explicitly joined. Default is enabled.

Ethernet to Wireless Blocking: When it is enabled, all connected PC on Ethernet port cannot access to any WiFi Client.

DHCP Mode: Set to *NONE* to disable the DHCP Server function. DHCP Server is activated as default.

IP Pool Range: Setup IP pool range that will be used for DHCP Server. User can click “*Show Client*” button to show information for all DHCP Clients.

Max Lease Time: Setup lease time for clients, default is 86400s.

Domain Name: Enter the domain name for your local area network (optional).

Gateway Address: It is the IP that will be assigned and activated as DHCP client’s gateway IP.

DNS option: This allows you to assign a DNS Servers to the requesting PC.

MAC-Based Assignment: This page allows to make DHCP server to release the fixed IP address to specified MAC address always.

WLAN

WLAN 2.4GHz / 5GHz

Basic Settings

This page is used to configure the parameters for WLAN clients which may connect to your Access Point. Here you may change wireless encryption settings as well as wireless network parameters.

WLAN Basic Settings

This page is used to configure the parameters for WLAN clients which may connect to your Access Point. Here you may change wireless encryption settings as well as wireless network parameters.

☐ **Disable WLAN Interface**

Band: 2.4 GHz (B+G+N) ▼

Mode: AP ▼ Multiple AP

SSID: TW-EAV510-2.4G-001

Channel Width: 20MHz/40MHz ▼

Control Sideband: Lower ▼

Channel Number: 1 ▼

PWR: H ▼

Associated Clients: Show Active WLAN Clients

Apply Changes

Disable WLAN Interface: The WLAN 2.4G/5G function will be disabled when it is checked.

Band: Specify the mode for Wireless standard support.

Mode: Default is Access Point mode.

Multiple AP: This device supports up to 3 external SSIDs which can be used for different service.

SSID: Network ID is used for identifying the Wireless LAN.

Channel Width: Select channel bandwidth for wireless, bigger bandwidth can get higher link rate. But it also depends on interference of your environment.

Control Sideband: This is available for 40MHz. Drop-down menu allows selecting upper sideband or lower sideband.

Channel Number: The radio channel number. The permissible channels depend on the Regulatory Domain. The factory default setting is auto channel selection.

PWR: Specify the transmitting power of your wireless signal.

S: Small / M: Medium / H: High

Associated Clients: Here you can view information about the wireless clients.

Advanced Settings

Here user can set some advanced parameters about wireless.

WLAN Advanced Settings

These settings are only for more technically advanced users who have a sufficient knowledge about WLAN. These settings should not be changed unless you know what effect the changes will have on your Access Point.

Fragment Threshold:	<input type="text" value="2346"/>	(256-2346)
RTS Threshold:	<input type="text" value="2347"/>	(0-2347)
Beacon Interval:	<input type="text" value="100"/>	(20-1024 ms)
Preamble Type:	<input checked="" type="radio"/> Long Preamble <input type="radio"/> Short Preamble	
Broadcast SSID:	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled	
Protection:	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled	
Aggregation:	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled	
Short GI:	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled	
WMM Support:	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled	

Fragment Threshold: A threshold (in bytes) whether the packets will be fragmented and at what size. Packets succeeding the fragmentation threshold of 802.11n WLAN will be split into smaller units suitable for circuit size. While the packets smaller than fragmentation threshold will not be fragmented. Default is 2346, setting the fragmentation too low may result in poor performance.

RTS Threshold: Request to Send (RTS) threshold specifies the packet size, when exceeds the size, the RTS/CTS will be triggered. The default setting of 2347(max length) will disable the RTS.

Beacon Interval: The amount of time between beacon transmissions in is milliseconds. The default is 100ms and the acceptable is 20- 1024. The beacon transmissions identify the presence of an access point.

Preamble Type: Set wireless LAN preamble type to long or short.

Broadcast SSID: user can only enter the SSID manually for connecting if **Disabled** box checked.

Protection: Turn off for maximized throughput. Turn on for greater security.

Short GI: This would provide an 11% increase in data rates once enabled. Using the Short Guard Interval will result in higher packet error rates when the delay spread of the RF channel exceeds the SGI, or if timing synchronization between the transmitter and receiver is not precise.

WMM Support: You can choose the enable or disable WMM which allows for priority of certain data over the wireless network

Security

Wireless security prevents unauthorized access or damage to computers using wireless network.

WLAN Security Settings

This page allows you setup the WLAN security. Turn on WEP or WPA by using Encryption Keys could prevent any unauthorized access to your wireless network.

SSID:

Encryption:

WPA Cipher Suite: ☒ TKIP ☒ AES

WPA2 Cipher Suite: ☒ TKIP ☒ AES

Group Key Update Timer:

Pre-Shared Key:

SSID choice: Apply the security settings to selected SSID.

Encryption: User can select one of the following authentications to secure your wireless network: None, WPA, WPA2 or WPA2 Mixed.

WPA Cipher Suite: Specify what cipher suite can be used.

WPA2 Cipher Suit: Specify what cipher suite can be used.

Group Key Update: The period of renewal time for changing the security key automatically between wireless client and Access Point (AP). This is in seconds.

Pre-Shared Key: Enter the key for your wireless security setting. Maximum length is 16 characters.

Access Control

The page helps user to make better security for the wireless network.

WLAN Access Control

If you choose 'Allowed Listed', only those WLAN clients whose MAC addresses are in the access control list will be able to connect to your Access Point. When 'Deny Listed' is selected, these WLAN clients on the list will not be able to connect the Access Point.

WPS

WPS (Wi-Fi Protected Setup) feature is a standard protocol created by Wi-Fi Alliance. WPS is used to exchange the AP setting with Station and configure AP settings. This feature greatly simplifies the steps needed to create a Wi-Fi network for a residential or an office setting. The commonly known PIN method is supported to configure WPS.

Wi-Fi Protected Setup

This page allows you to change the setting for WPS (Wi-Fi Protected Setup). Using this feature could let your WLAN client automatically synchronize its setting and connect to the Access Point in a minute without any hassle.

WAN

WAN Mode

The page is used to configure which WAN connection mode will be used or not.

WAN Mode

This page is used to configure which WAN to use of your Router.

WAN Mode: ☒ ATM ☒ Ethernet ☒ PTM

Default Routing

This page is used to configure the priority of each WAN connection. Top one has higher priority than lower one. If you have multi-WAN connection available, it will do auto failover and auto fallback according to the priority setting here.

Default Routing Gateway Priority

Default gateway interface list can have multiple WAN interfaces served as system default gateways but only one will be used according to the priority with the first being the highest and the last one the lowest priority if the WAN interface is connected. Priority order can be changed by up and down them back in again.

Profile: Select the profile for configuration or new link to create a new profile.

Enable VLAN: User can check this box to enable the VLAN on specify profile.

VLAN ID: Assign a VLAN ID tag between 0 and 4094

802.1p_Mark: Select an 802.1p priority level between 0 and 7.

Channel Mode: Select the channel mode for WAN connection.

Bridge Mode: Set bridge mode to make all transparent between Ethernet and WAN or PPPoE packet only.

Enable NAPT: Enable/Disable the NAT function for WAN connection.

Channel: Enable/Disable the channel.

Default Route: Specify the profile will be activated as default gateway for Internet connection or not.

Enable QoS: Enable/Disable the QoS for WAN connection.

MTU: Most ISP offers MTU value to users.

Enable IGMP-Proxy: Enable/Disable the IGMP Proxy. If disabled, the IPTV will not work with NAT enabled mode.

IP Protocol: Setup profile's IP protocol to be IPv4 only, IPv6 only or IPv4/IPv6 dual stack.

When **Channel Mode** is set to **IPoE**, you will have the options below.

Type: Setup the WAN interface is use static IP or activate as DHCP client and get WAN IP from ISP.

Local IP Address/Remote IP Address/Subnet Mask: Enter the IP address, subnet mask and gateway address that provided by your ISP.

Request DNS: If this option is enabled, the device will use the DNS Server IP that assigned from ISP. It is only work when **Type** is set to **DHCP**.

Primary DNS Server/Secondary DNS Server: Input the primary and secondary DNS server if necessary.

When **Channel Mode** is set to **PPPoE**, you will have the options below.

Username/Password: Enter the PPPoE username/password that provided by your ISP.

Type: Specify the PPP connection should be always on (**Continuous**) or only make connection when necessary (**Connect on Demand**) or manually to make Connect/Disconnect.

Idle Time (sec): Specify the idle time for disconnecting the PPPoE connection.

Authentication Method: Specify the authentication method for PPPoE connection.

When IP Protocol is set to **IPv6** or **IPv4/IPv6**, you will have the options below.

Address Mode: Specify the mode for getting or setting IPv6 address.

Enable DHCPv6 Client: Pass the IPv6 address to LAN network when box checked.

Add

PPTP Client Table

Select	Name	Interface	Server	Default Gateway	Peer Network	Action
Delete Selected						

PPTP VPN: Enable/Disable PPTP function.

PPTP Server

Authentication Type: Setup the authentication type for client.

Encryption Mode: Setup MPPE encryption for PPTP tunnel, MPPE can only be enabled when *Auth. Type* set to MS-CHAPV2.

Assigned to Peer IP Address start from: Enter the IP address that will be assigned to remote PPTP client. The IP address cannot in DHCP IP Pool range.

Local IP Address: Enter the IP address for PPTP tunnel interface. Default is set to device LAN IP address. Example: 192.168.0.254.

Server Account

Name: Enter the name for this account profile.

Account: Enable/Disable this account.

Username: Enter the username for login authentication.

Password: Enter the password for login authentication.

Peer IP: Enter the peer side LAN IP address for LAN to LAN type.

Peer Subnet Mask: Enter the peer side LAN subnet mask for LAN to LAN type.

PPTP Client

Name: Enter the name for this client rule.

Server IP Address: Specify the remote PPTP server IP address or domain name.

Username: Enter the username for PPTP login authentication.

Password: Enter the password for PPTP login authentication.

Authentication Type: Setup the authentication type for connecting to PPTP server.
This setting must follow server side.

Encryption Mode: Setup MPPE encryption for PPTP tunnel, MPPE can only be enabled when *Auth. Type* set to MS-CHAPV2. This setting must follow server side.

Default Gateway: Make this PPTP tunnel as default gateway for all local traffic when it is checked.

Peer IP: Enter the peer side LAN IP address for LAN to LAN type.

Peer Subnet Mask: Enter the peer side LAN subnet mask for LAN to LAN type.

How to for PPTP Server/Client

Example 1

TW-EAV510 AC in below pic left side is activated as PPTP Server and TW-EAV510 AC in below right side is activated as PPTP Client.

Remote Access

TW-EAV510 (PPTP Server)

1. Go to **WAN -> VPN -> PPTP**, enable the PPTP VPN
2. Setup PPTP Server and press **Apply** button
3. Add new user account, don't need input Peer IP/ Peer Subnet Mask.

PPTP Server

Authentication Type:

Select	Name	Enable	Username	Password
<input type="checkbox"/>	admin	<input checked="" type="checkbox"/>	admin	admin

TW-EAV510 AC (PPTP Client)

1. Go to **WAN -> VPN -> PPTP**, enable the PPTP VPN, Setting PPTP Client as below.

PPTP Client

Name:	<input type="text" value="admin"/>	Server IP Address:	<input type="text" value="36.229.14.220"/>
Username:	<input type="text" value="admin"/>	Password:	<input type="text" value="admin"/>
Authentication Type:	<input type="text" value="CHAP"/>	Encryption Mode:	<input type="text" value="NONE"/>
Default Gateway:	<input type="checkbox"/>		
Peer IP:	<input type="text" value="optional, e.g. 10.0.0.1"/>	Peer Subnet Mask:	<input type="text" value="optional, e.g. 255.255.255.255"/>

Add

PPTP Client Table

Select	Name	Interface	Server	Default Gateway	Peer Network	Action
Delete Selected						

Click **Add** button to save account settings.

- After click **Add** button, **PPTP Client Table** would add one connection, if setup all correctly VPN connection should be connected. You can also click **Disconnect** button to disconnect the PPTP connection.

PPTP Client Table

Select	Name	Interface	Server	Default Gateway	Peer Network	Action
<input type="checkbox"/>	admin	ppp9_pptp0	36.229.14.220	off		Disconnect
Delete Selected						

- Go to **Status -> Device**, you can check **PPTP Configuration** on page below, When **Status** shows **up**, you can access to remote network now. Below is Device Info for reference.

PPTP Configuration

Interface	Protocol	IP Address	Gateway	Status
ppp9	PPP	192.168.100.200	192.168.0.254	up

LAN to LAN

TW-EAV510 (PPTP Server)

- Go to **WAN -> VPN -> PPTP**, enable the PPTP VPN
- Setup PPTP Server and press **Apply** button
- Add new user account, enter remote network's IP address for Peer IP/ Peer Subnet Mask.

PPTP Server

Authentication Type: CHAP

Encryption Mode: NONE

Assigned to Peer IP
Address start from: 192.168.100.200

Local IP Address: 192.168.0.254

Apply

Server Account

Name: user

Account: ☐ Disable ☒ Enable

Username: user

Password: user

Peer IP: 192.168.10.254

Peer Subnet Mask: 255.255.255.0

Add

4. After press **Add** button, **PPTP Server Table** would add account as below.

PPTP Server Table				
Select	Name	Enable	Username	Password
<input type="checkbox"/>	user	<input checked="" type="checkbox"/>	user	user
Delete Selected		Save		

TW-EAV510 AC (PPTP Client)

1. Go to **WAN -> VPN -> PPTP**, enable the PPTP VPN, Setting PPTP Client as below. For LAN to LAN, you need to enter peer network information.

PPTP Client

Name: user

Server IP Address: 36.229.14.220

Username: user

Password: user

Authentication Type: CHAP

Encryption Mode: NONE

Default Gateway: ☐

Peer IP: 192.168.0.254

Peer Subnet Mask: 255.255.255.0

Add

Click **Add** button to save account settings.

2. After click **Add** button, **PPTP Client Table** would add one connection, if setup all correctly VPN connection should be connected. You can also click **Disconnect** button to disconnect the PPTP connection.

PPTP Client Table						
Select	Name	Interface	Server	Default Gateway	Peer Network	Action
<input type="checkbox"/>	user	ppp9_pptp0	36.229.14.220	off	192.168.0.254 255.255.255.0	Disconnect
Delete Selected						

3. Go to **Status -> Device**, you can check **PPTP Configuration**, When **Status** shows **up**, both local and remote network can access each other. Below is Server Info for reference.

PPTP Configuration				
Interface	Protocol	IP Address	Gateway	Status
ppp9	PPP	192.168.100.200	192.168.0.254	up

Example 2

TW-EAV510 is activated as PPTP Server and Windows 10 is activated as PPTP Client for Remote Access.

TW-EAV510 (PPTP Server)

1. Same setting with Remote Access.
2. Don't need input Peer IP/ Peer Subnet Mask.

PPTP Server

Authentication Type:	<input type="text" value="CHAP"/>	Encryption Mode:	<input type="text" value="NONE"/>
Assigned to Peer IP Address start from:	<input type="text" value="192.168.100.254"/>	Local IP Address:	<input type="text" value="192.168.0.254"/>
<input type="button" value="Apply"/>			

Server Account

Name:	<input type="text" value="admin"/>	Account:	<input type="radio"/> Disable <input checked="" type="radio"/> Enable
Username:	<input type="text" value="admina"/>	Password:	<input type="text" value="admin"/>
Peer IP:	<input type="text" value="optional, e.g. 10.0.0.1"/>	Peer Subnet Mask:	<input type="text" value="optional, e.g. 255.255.255."/>

PPTP Server Table

Select	Name	Enable	Username	Password
<input type="checkbox"/>	admin	<input checked="" type="checkbox"/>	admin	admin

Windows 10 (PPTP Client)

1. Make sure PC can access internet.
2. Go to **Control Panel -> Network and Internet -> Network and Sharing Center** click **Setup a new connection or network** to add a new PPTP connection.

Change your networking settings

Set up a new connection or network

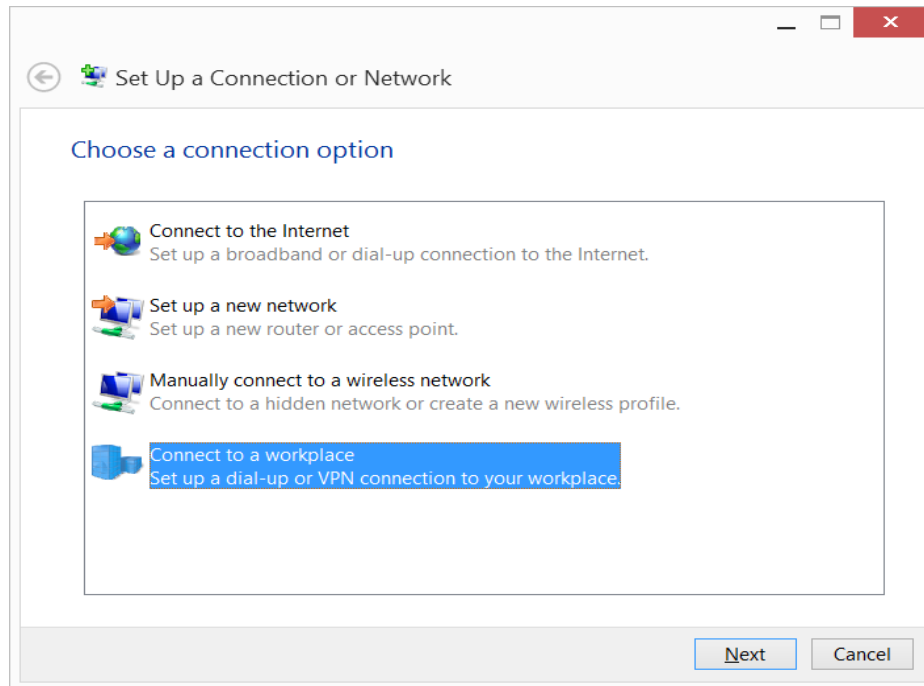

Set up a broadband, dial-up, or VPN connection; or set up a router or access point.

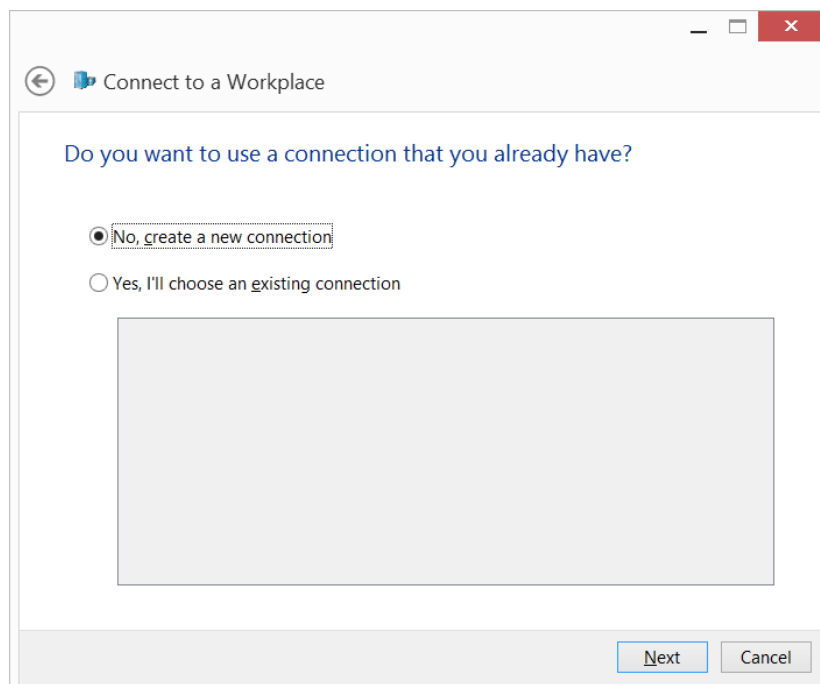

Troubleshoot problems

Diagnose and repair network problems, or get troubleshooting information.

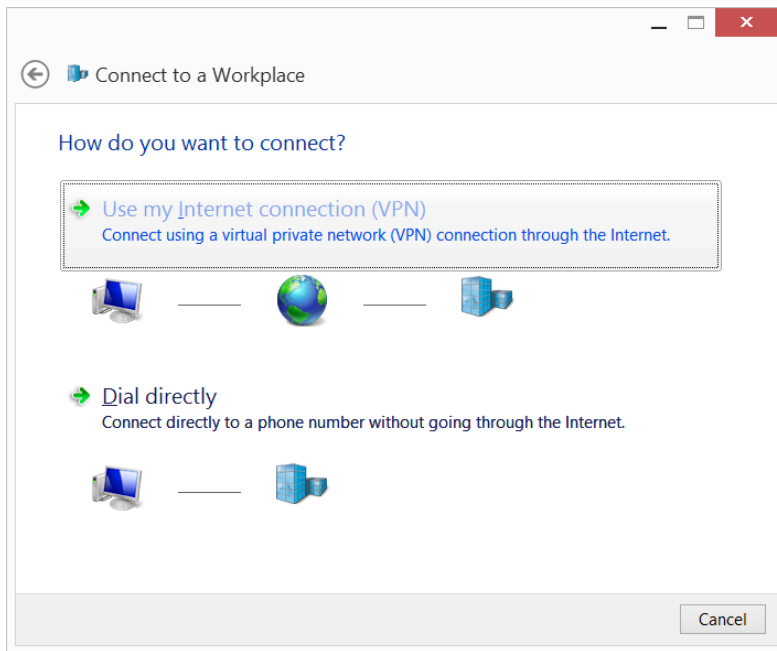

3. Select **Connect to a workplace**.

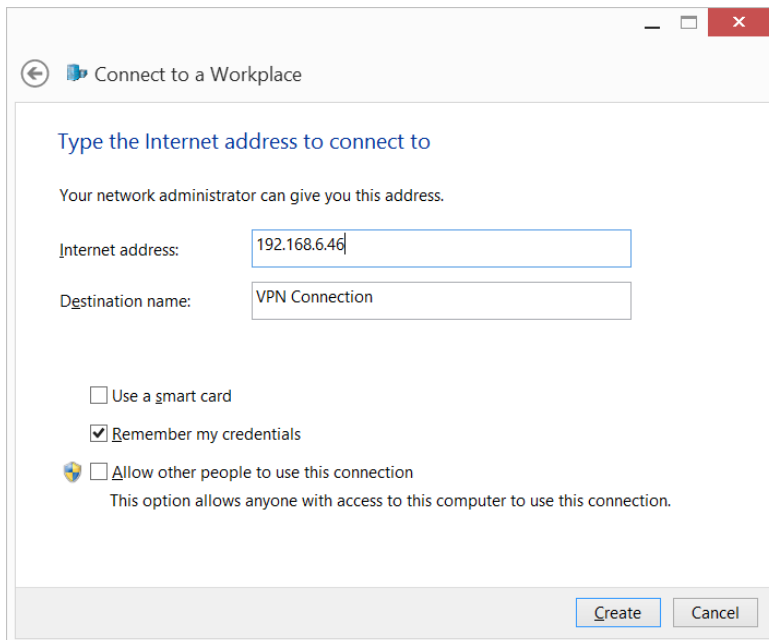

4. Select **No, create a new connection** and click **Next** button for next step.

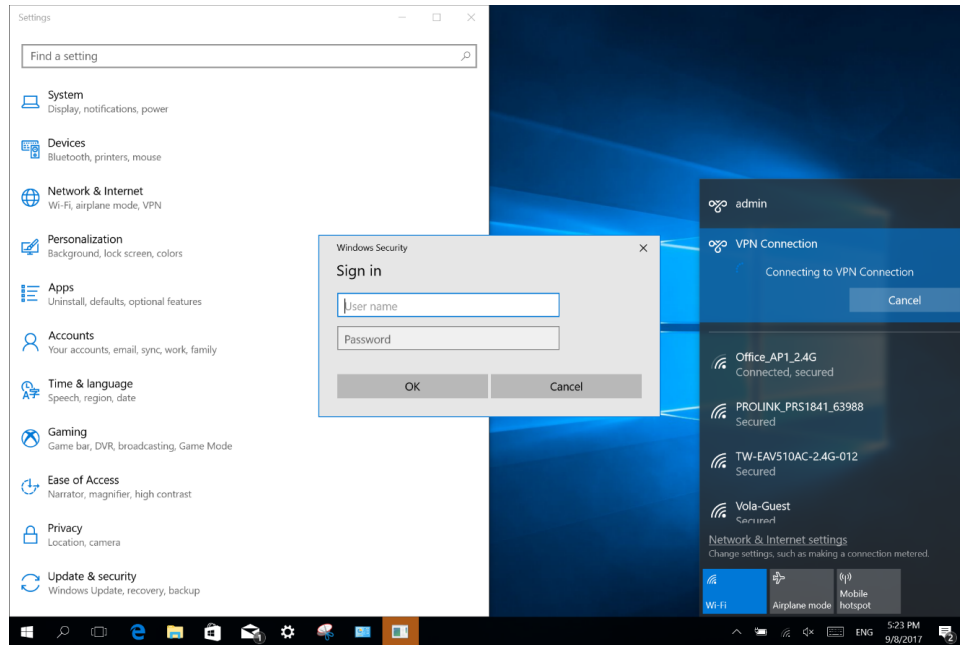

5. Select **Use my Internet connection (VPN)**.

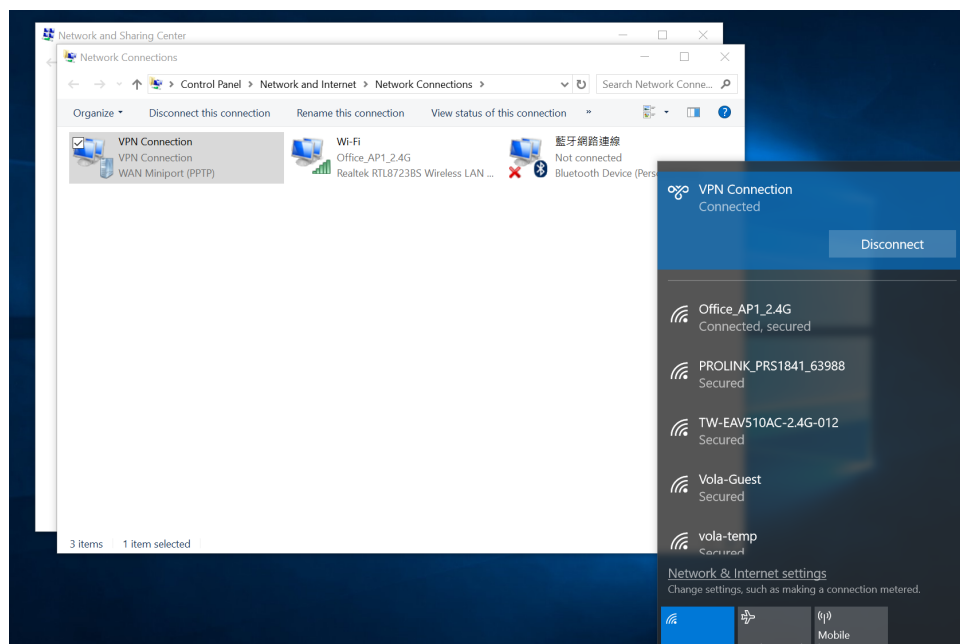

6. Enter the PPTP Server address/domain to field named **Internet address**. Please make sure your domain name address is work correctly if you are use domain name instead of IP address. Click **Create** button finish the PPTP client settings on Windows.

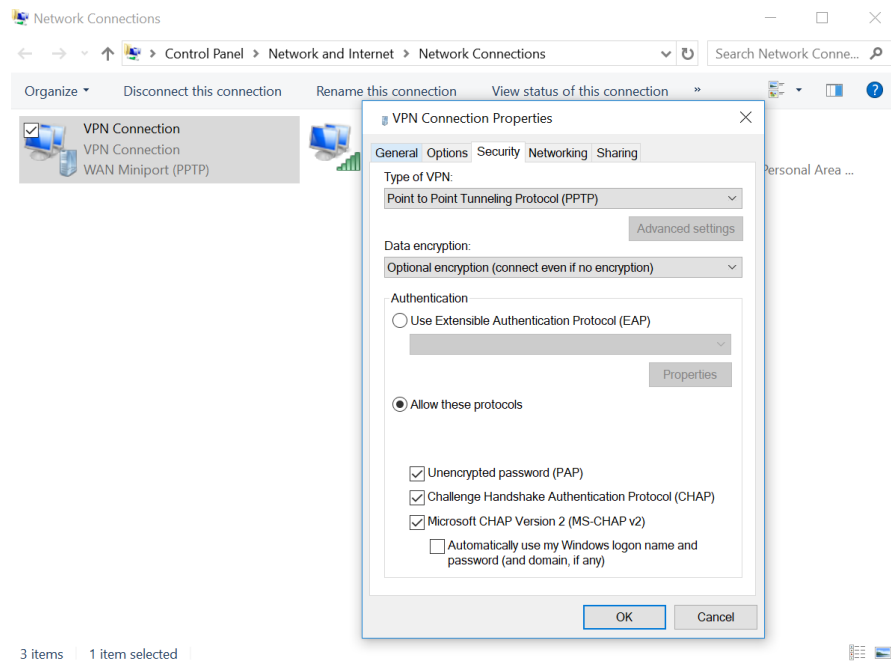

7. Enter the **username** and **password** that set on TW-EAV510/510AC's PPTP Server and click **OK** button to connect to PPTP Server.

8. After connected, you can access remote network now.

9. If you have problem connect with PPTP VPN via PC, please check **Control Panel -> Network and Internet -> Network and Sharing Center**, click **Change adapter settings** on left side, would show VPN Connection then right click to select **Properties -> Security**. Choose **Type of VPN** to **Point to Point Tunneling Protocol(PPTP)**, and choose **Allow these protocols** also according to VPN server **Authentication Type** to enable authentication. Please check as below.

L2TP

This page is for setting L2TP Server, Client and Account.

Enable	State	Type	IPSec gateway address	Remote Network	WAN IP address	Local Network	Mode
<input type="button" value="Delete Selected"/>	<input type="button" value="Enable"/>	<input type="button" value="Disable"/>					

Remote

IPSec Gateway Address: Enter the remote IPSec gateway address.

LAN IP address: Enter the remote local IP address that will access to this IPSec tunnel.

Subnet Mask: Enter the remote local subnet mask that will access to this IPSec tunnel.

Local

WAN IP address: Enter local WAN IP address which will be used for connecting to remote IPSec gateway address.

LAN IP address: Enter the local LAN IP address that will access to this IPSec tunnel.

Subnet Mask: Enter the local subnet mask that will access to this IPSec tunnel.

Security Option

Encapsulation Type: Select the encapsulation type for tunnel using.

Pre-shared key: Enter the pre-shared key for IPSec tunnel.

Advanced Options: Make it checked to modify the advanced setting for IKE phase 1 and 2.

IKE Phase 1

Mode: Default is Main mode.

IKE Algorithm

Encryption Algorithm: Select the algorithm that will be used for tunnel connection.

Integrity Algorithm: Select the algorithm that will be used for tunnel connection.

Select Diffie-Hellman Group: Select the group that will be used for tunnel connection.

IKE Phase 2

Security Algorithm

Encryption Algorithm: Select the algorithm that will be used for tunnel connection.

Integrity Algorithm: Select the algorithm that will be used for tunnel connection.

Select Diffie-Hellman Group: Select the group that will be used for tunnel connection.

Note: Both sides must use the same IKE phase 1 and 2 settings for creating IPSec tunnel.

How to for IPsec

Example

Both TW-EAV510 AC are enable IPsec function. IPsec is point-to-point, no server and client distinguish.

Remote Side

TW-EAV510 AC

1. Go to **WAN -> VPN -> IPsec**, in **Remote** part fill in other side WAN IP or domain, router LAN IP, for **Local** part, isn't necessary fill in, because system will automatically enter, input Pre-Shared Key for authenticate, like as below picture.

This page is used to configure the parameters for IPsec mode VPN.

Remote:	
IPSec gateway address	36.229.14.220
LAN IP address	192.168.0.254
Subnet Mask	255.255.255.0
Local:	
WAN IP address	0.0.0.0
LAN IP address	0.0.0.0
Subnet Mask	255.255.255.0
Security Option:	
Encapsulation Type	ESP
Pre-Shared Key	psk12345678
Advanced Options	<input type="checkbox"/>
<input type="button" value="Add / Save"/>	

Click **Add/Save** button to save changes.

2. After Add the new config, **Key Life Time** would add one connection, user can disable/enable or delete selected.

Key Life Time								
	Enable	State	Type	IPSec gateway address	Remote Network	WAN IP address	Local Network	Mode
<input type="checkbox"/>	Enable	Established	AUTO	36.229.14.220	192.168.0.254	0.0.0.0	192.168.10.254	ESP
<input type="button" value="Delete Selected"/>				<input type="button" value="Enable"/>	<input type="button" value="Disable"/>			

Local Side

1. Go to **WAN -> VPN -> IPSec**, input other side router WAN IP like as below picture.

This page is used to configure the parameters for IPsec mode VPN.

Remote:

IPSec gateway address

LAN IP address

Subnet Mask

Local:

WAN IP address

LAN IP address

Subnet Mask

Security Option:

Encapsulation Type

Pre-Shared Key

Advanced Options ☐

Click **Add/Save** button to save changes.

2. After Add the new config, **Key Life Time** would add one connection, user can disable/enable or delete selected.

Key Life Time								
	Enable	State	Type	IPSec gateway address	Remote Network	WAN IP address	Local Network	Mode
<input type="checkbox"/>	Enable	Established	AUTO	36.225.80.226	192.168.10.254	0.0.0.0	192.168.0.254	ESP
<input type="button" value="Delete Selected"/>			<input type="button" value="Enable"/>		<input type="button" value="Disable"/>			

3. After both side setup ready, use PC launch CMD, try to ping other side PC, first time should be time out then would ping successfully. Now you can access to remote network.

Services

DNS

Dynamic DNS

The Dynamic DNS function allows you to alias a dynamic IP address to a static hostname, allowing users whose ISP does not assign them a static IP address to use a domain name. This is especially useful for hosting servers via your ADSL/VDSL connection, so that anyone wishing to connect to you may use your domain name, rather than having to use your dynamic IP address, which changes from time to time. This dynamic IP address is the WAN IP address of the router, which is assigned to you by your ISP.

Each DDNS Provide has different settings. You will first need to register and establish an account with the Dynamic DNS / No-IP/dy.fi provider using their website, for example <https://dyn.com/dns/>.

Dynamic DNS Configuration

This page is used to configure the Dynamic DNS address from DynDNS.org or No-IP. Here you can Add/Remove to configure Dynamic DNS.

Port Forwarding

In TCP/IP and UDP networks a port is a 16-bit number used to identify which application program (usually a server) incoming connections should be delivered to. Some ports have numbers that are pre-assigned to them by the IANA (the Internet Assigned Numbers Authority), and these are referred to as “well-known ports”. Servers follow the well-known port assignments so clients can locate them. If you wish to run a server on your network that can be accessed from the WAN (i.e. from other machines on the Internet that are outside your local network), or any

application that can accept incoming connections (e.g. Peer-to-peer/P2P software such as instant messaging applications and P2P file-sharing applications) and are using NAT (Network Address Translation), then you will usually need to configure your router to forward these incoming connection attempts using specific ports to the PC on your network running the application. You will also need to use port forwarding if you want to host an online game server. The reason for this is that when using NAT, your publicly accessible IP address will be used by and point to your router, which then needs to deliver all traffic to the private IP addresses used by your PCs. Please see the WAN configuration section of this manual for more information on NAT.

The device can be configured as a virtual server so that remote users accessing services such as Web or FTP services via the public (WAN) IP address can be automatically redirected to local servers in the LAN network. Depending on the requested service (TCP/UDP port number), the device redirects the external service request to the appropriate server within the LAN network.

This part is only available when **NAPT** is enabled.

Port Forwarding

Entries in this table allow you to automatically redirect common network services to a specific machine behind the NAT firewall. These settings are only necessary if you wish to host some sort of server like a web server or mail server on the private local network behind your Gateway's NAT firewall.

Static Route Table						
Select	State	Destination	Subnet Mask	Next Hop	Metric	Interface

Enable: Checked to enable static route function.

Destination/Subnet Mask: Enter the destination IP address and the subnet mask.

Next Hop: Specify the gateway IP address for routing to next network.

Metric: Metric is a policy for router to commit router, to determine the optimal route. Enter one number greater than or equal to 0.

Interface: Select an interface this route associated.

Multicast

Multicast is one of the three network transmission modes, Unicast, Multicast, and Broadcast. It is a transmission mode that supports point-to-multipoint connections between the sender and the recipient. IGMP protocol is used to establish and maintain the relationship between IP host and the host directly connected multicast router. IGMP stands for Internet Group Management Protocol, it is a communications protocols used to manage the membership of Internet Protocol multicast groups. IGMP is used by IP hosts and the adjacent multicast routers to establish multicast group members.

IGMP Proxy Configuration

IGMP Version:	<input type="text" value="v2"/>
Query Interval:	<input type="text" value="125"/>
Query Response Interval:	<input type="text" value="10"/>
Last Member Query Interval:	<input type="text" value="10"/>
Robustness Value:	<input type="text" value="2"/>

IGMP Version: Enter the supported IGMP version v2 and v3, default is IGMP v2.

Query Interval: Enter the periodic query interval time (sec) the multicast router sending the query message to hosts to understand the group membership information.

Query Response Interval: Enter the response interval time (sec).

Last Member Query Interval: Enter the last member response interval time (sec).

Robustness Value: Enter the router robustness parameter, the greater the robustness value, the more robust the querier is.

Interface Grouping

Interface grouping is a function to group interfaces, known as VLAN. A Virtual LAN, is a group of hosts with the common set of requirements that communicate as if they were attached to the same broadcast domain, regardless of the physical location. Each group will perform as an independent network.

Interface Grouping Configuration

To manipulate a mapping group:

1. Select a group from the table.
2. Select interfaces from the available/grouped interface list and add it to the grouped/available interface list using the arrow buttons to manipulate the required mapping of the ports.
3. Click the 'Apply Changes' button to save the changes.

Note: The selected interfaces will be removed from their existing groups and added to the new group. Only WAN interface with pure bridge setting will be shown here.

Auto Config by Prefix Delegation for DHCPv6 Server:

DHCPv6 Mode: Set to **DHCPv6Server(Auto)** to assign the IPv6 address to all LAN clients or set to **NONE** to disable it.

MLD Proxy

The MLD Proxy feature provides a mechanism for a device to generate MLD membership reports for all entries or a user-defined subset of these entries on the device's upstream interface. The MLD proxy feature enables a device to learn proxy group membership information, and forward multicast packets based upon that information.

MLD Proxy Configuration

This page be used to configure MLD Proxy.

MLD Proxy: ☒ Disable ☐ Enable

WAN Interface:

MLD Proxy: Enable or disable the MLD Proxy function.

WAN Interface: Set the upstream interface for MLD Proxy. The WAN interface must has IPv6 enabled for showing here.

MLD Snooping

Similar to IGMP snooping, listens in on the MLD conversation between hosts and routers by processing MLD packets sent in a multicast network, and it analyzes all MLD packets between hosts and the connected multicast routers in the network. Without MLD snooping, multicast traffic is treated in the same manner as broadcast traffic - that is, it is forwarded to all ports. With MLD snooping, multicast traffic of a group is only forwarded to ports that have members of that group.

MLD SnoopingConfiguration

This page be used to configure MLD Snooping.

Static IPv6 Route Table:

Select	State	Destination	Next Hop	Metric	Interface
--------	-------	-------------	----------	--------	-----------

Enable: Checked to enable static route function.

Destination: Enter the destination IPv6 address.

Next Hop: Specify the gateway IPv6 address for routing to next network.

Metric: Metric is a policy for router to commit router, to determine the optimal route. Enter one number greater than or equal to 0.

Interface: Select an interface this route associated.

IP/Port Filtering

IPv6 IP/Port Filtering

Entries in this table are used to restrict certain types of data packets through the Gateway. Use of such filters can be helpful in securing or restricting your local network.

Outgoing Default Action ☐ Deny ☒ Allow

Incoming Default Action ☒ Deny ☐ Allow

Delete Selected

Delete All

Outgoing Default/Incoming Default Action: Specify the default action for the unmatched traffic in **Current Filter Table**.

Direction: Specify the direction of traffic.

Protocol: Specify the protocol of traffic.

Rule Action: Specify what action will be applied to this rule.

Source Interface ID/Destination Interface ID: Enter the information of traffic that will be hooked by filter.

Source/Destination Port: Enter the port information of traffic that will be hooked by filter.

Diagnostics

Ping

This page will help you to diagnostic the status of your Network. You can use “Ping” methods in this page. After you input the IP address, click **Go** button.

Ping Diagnostics

This page is used to send ICMP ECHO_REQUEST packets to network host. The diagnostic result will then be displayed.

Host Address:

Go

Management

This page allows user to reboot your device. All services will be terminated during rebooting.

Backup/Restore

This page allows user to backup or restore the router settings to/from file.

Backup and Restore Settings

This page allows you to backup current settings to a file or restore the settings from the file which was saved previously. Besides, you could reset the current settings to factory default.

Backup Settings to File:

Restore Settings from File:

Reset Settings to Default:

Password

The administrator password can be changed by this page. Suggest to change default password for better security protection.

Password Configuration

This page is used to set the account to access the web server of your device. Emptying the username and password field will disable the protection.

Firmware Upgrade

The firmware keeps enhancement and improvement. This page allows user to upgrade to a new firmware once it is available.

Click “**Upgrade(auto)**” button will upgrade the up to date firmware from remote server, please make sure the Internet connection is work before clicking.

Firmware Upgrade

This page allows you to upgrade the firmware to the latest version. Do NOT switch the power of the device off during the upload, as this will make the system unbootable.

☐ **Upload firmware with default configuration**

Browse...

No file selected.

Upgrade

Upgrade(auto)

Important: Please don't power off the router during upgrade, otherwise it may damage your router.

ACL

This page allows user to allow/block to access the router's service with specify IP address or network on both LAN and WAN direction.

ACL Configuration

This page is used to configure the IP Address for the Access Control List. If ACL is enabled, only the IP address in the ACL Table can access the CPE. Here you can add/delete the IP Address.

Note: Once ACL is enabled, the device's HTTP service are not reachable from the WAN interface if the default login password is not changed!

ACL Capability: ☐ Disable ☒ Enable Apply Changes

Enable: ☒

Interface:

LAN ▾

IP Address: 0.0.0.0 -> Allows connections from anywhere.

Subnet Mask: 0.0.0.0 -> Allows connections from anywhere.

ServiceName	LAN
Any	<input type="checkbox"/>
TELNET	<input type="checkbox"/>
HTTP	<input type="checkbox"/>
HTTPS	<input type="checkbox"/>
SNMP	<input type="checkbox"/>
PING	<input checked="" type="checkbox"/>

Add
